

Green Packaging, Inc.

Anti-Corrosion Packaging Solutions

A Recognized Leader
in the Field of Anti-Corrosion Packaging

Electronics

The American and global electronics industry, has gained momentum in the past decade. The USA has seen significant volume manufacturing in the production of electronics equipment and components. USA and Japan will also remain major the two countries accounting for around a third of the global market.

Green Packaging, Inc. offers environmental packaging solutions for electronics manufacturers in the United States. Some of the electronic areas that we serve are computing, office equipment, control and instrumentation, medical and industrial, radio communications, and telecommunications.

Many electronic components and parts are sensitive to weather and moisture while being packed and shipped. Green Packaging, Inc. carries a wide range of VCI and other environmentally friendly packaging products that will protect and prevent electronic components from rust and corrosion.

VCI packaging has a built-in defense mechanism, unlike barrier film products. As temperature and humidity increase, causing a more corrosive environment, the VCI packaging films emit more protective molecules, as the molecules emit at a faster rate. Our proprietary VCI formulation is extremely effective on all types of metal electronic parts. We have the correct VCI products that will offer your parts premium protection from rust and corrosion.

We offer state-of-the-art accelerated corrosion testing in our lab at no charge.

Call today for your free corrosion consultation, samples, or a price quotation on all of your VCI packaging requirements.
