Anti-Corrosion Packaging Solutions

9 Ways That VCI Packaging Can Improve Your Company's Image and Bottom Line

VCI (Vapor Corrosion Inhibitor) packaging is a safe, clean, easy, economical method of rust prevention. VCI products can safely and effectively eliminate the need for messy, expensive, ineffective, unhealthy rust preventative (R.P.) oils. Here are just 9 ways that VCI packaging will help your company save money, improve the health of your employees, and help the environment:

1. VCI packaging is less expensive than R.P. oils and requires much less labor and time than spraying, dipping or brushing on R.P. oils.
2. VCI products protect metal parts from corrosion more effectively than conventional corrosion inhibitors such as R.P. oils..
3. VCI Paper and VCI poly bags are recyclable, greatly reducing disposal costs.
4. VCI packaging eliminates the disposal costs associated with oily rags and used 55 gallon drums.
5. VCI paper and VCI poly bags can be imprinted with your company logo, enhancing your company's image in the eyes of your customers.
6. When your customers receive your parts protected with VCI packaging, the parts will arrive clean, dry, and corrosion-free, meaning that your customers will no longer have to remove oils and greases. This adds great value to your parts.
7. VCI products are safe for the health of your employees and the health of our environment.
8. Unlike R.P. oils, VCI packaging will keep your metal parts rust-free for several years.
9. VCI packaging improves your company's image because your customers will clearly see that your company is using the most up-to-date, modern, clean, safe and effective products to protect their parts from rust and corrosion.
